

Bug Fix Log — Sprint 4

HEALTH-AI ML Learning Tool · Jira · SENG 384 — Software Quality Assurance

Sprint 4 · April 2026 · Total issues: 12 · Bugs: 6 · Test Executions: 6 · Open at close: 0

Sprint Summary

Sprint 4 completed a full pipeline test across all 7 steps (US-001 to US-040) with 32 screenshots as evidence. All 40 user stories passed. The table below documents all issues raised during Sprints 3 and 4, including defects fixed before Sprint 4 close and test execution items verified as working correctly. No open defects remained at sprint close.

Metric	Value
Total issues logged	12
Bugs (defects)	6
Test Execution items (no defect)	6
High priority	2
Medium priority	5
Low priority	5
Open issues at Sprint 4 close	0 — all closed
User stories verified PASS	40 / 40 (US-001 to US-040)

Issue Log

Issue ID	Type	Priority	Found	Summary	Description	Resolution	Status
HAI-101	Bug	Medium	Sprint 3	SMOTE cannot be applied when minority class has fewer than 6 samples	When a dataset has classes with fewer than 6 training samples, the SMOTE algorithm fails. The Step 3 panel showed no visual feedback and	Closed. Red warning message added: "SMOTE could not be applied — some classes have fewer than 6 samples. Consider using	Closed

Issue ID	Type	Priority	Found	Summary	Description	Resolution	Status
					proceeded silently. Reproduced with the Radiology multi-class dataset (TR_021).	class weights instead." Green Ready banner still appears so users can proceed. Sprint 4 pipeline confirmed SMOTE applied correctly on the Cardiology dataset (67.8% to 50%/50%, Image 7).	
HAI-102	Bug	Medium	Sprint 3	Low Sensitivity safety banner not visible without scroll on small viewports	On viewports narrower than 1280 px, the Low Sensitivity safety banner triggered at 47% sensitivity (TR_045) was rendered below the fold with no visual indicator that an alert existed further down the page. Users could miss a safety-critical message.	Closed. Banner repositioned to appear above the confusion matrix on small viewports in the Sprint 4 build. TR_045 verified PASS in the Steps 4 and 5 report (March 28, 2026).	Closed
HAI-103	Bug	Medium	Sprint 3	Model Comparison table stored duplicate rows on repeated training runs	Training the same algorithm with the same configuration more than once appended a new row each time rather than updating the existing entry. The comparison table became cluttered and metrics were shown multiple	Closed. Deduplication logic implemented in Sprint 3 — each model and configuration key now overwrites the existing entry. Sprint 4 full pipeline confirmed the comparison table shows unique entries only (Image 11).	Closed

Issue ID	Type	Priority	Found	Summary	Description	Resolution	Status
					times for the same model.		
HAI-104	Bug	High	Sprint 4	EU AI Act Checklist loaded with 0 items checked instead of expected 2 on first render	On initial pipeline completion and navigation to Step 7, the EU AI Act Compliance Checklist loaded with 0 of 8 items checked and showed 0% progress. The two items automatically satisfied by the pipeline ("Model is explainable" and "Training data is documented") should be pre-checked on load.	Closed. Initialisation logic patched so that the two auto-satisfied items are pre-checked on component mount, displaying 2 of 8 (25%) on load. Verified Image 22.	Closed
HAI-105	Bug	High	Sprint 4	Bias detection banners not appearing for subgroup sensitivity gap exactly at 10 pp boundary	The bias banner trigger used a strict greater-than comparison (> 10 pp). Subgroups with a sensitivity gap of exactly 10 percentage points did not trigger a banner, contrary to the acceptance criterion that specifies banners should be hidden at ≤ 10 pp and appear at > 10 pp. The boundary was correct in specification but had not been explicitly tested.	Closed. Boundary condition verified: banner hidden at exactly 10 pp and visible at 11 pp. Threshold logic confirmed correct per acceptance criteria. Verified Image 24.	Closed

Issue ID	Type	Priority	Found	Summary	Description	Resolution	Status
HAI-106	Bug	Medium	Sprint 4	Training Data chart shows 0% for all age bands when CSV has no Age column (Ophthalmology)	When an uploaded CSV does not include an Age or sex/gender column, the Training Data Representation chart in Step 7 displayed 0% for all demographic bands with no explanatory message. The bias subgroup rows also failed to populate, which could mislead users into thinking the model had no bias findings rather than that demographic data was simply unavailable.	Closed. Informational message added below the chart: "Subgroup rows require an Age and/or sex/gender column in the CSV." Generated certificate for Ophthalmology domain reflects the missing-data message correctly. Verified Image 25 and Certificate 3 in the Sprint 4 report.	Closed
HAI-107	Test Execution	Low	Sprint 4	Verify: Step 3 gate blocks Step 4 before Apply Preparation Settings	Test execution item to confirm gate behaviour. Clicking Next Step before applying preparation settings must trigger an Action required modal and prevent navigation to Step 4.	No Defect. Gate modal confirmed: "You must click Apply Preparation Settings to process your data before continuing to Step 4." Verified Image 6 (Sprint 4 report).	Closed
HAI-108	Test Execution	Low	Sprint 4	Verify: Step 5 gate blocks access before any model is trained in Step 4	Test execution item to confirm gate behaviour. Navigating to Step 5 before training at least one model	No Defect. Modal confirmed: "You must train at least one model in Step 4 before viewing the results in Step	Closed

Issue ID	Type	Priority	Found	Summary	Description	Resolution	Status
					must trigger an Action required modal.	5." Verified Image 8 (Sprint 4 report).	
HAI-109	Test Execution	Medium	Sprint 4	Verify: PDF certificate generates correct domain-specific content for 3 domains	Test execution item to confirm certificate generation. Certificates for Endocrinology, Cardiology, and Ophthalmology must each reflect the correct clinical domain, model comparison metrics, bias findings, and EU AI Act checklist status.	No Defect. All 3 certificates generated correctly in under 10 seconds. Network log confirmed HTTP 200 with 9 ms response time. Verified Images 30, 31, 32 and certificate content in the Sprint 4 report.	Closed
HAI-110	Test Execution	Low	Sprint 4	Verify: Domain Switch confirmation modal fires from Step 6 context	Test execution item to extend coverage of the domain switch modal. Previously only verified at Step 1. Must also trigger correctly from Step 6 mid-pipeline (e.g. switching from Cardiology to Hepatology).	No Defect. Modal correctly appears from Step 6 context with message: "Are you sure you want to switch the domain to Hepatology? This will reset your current progress and return you to Step 1." Verified Image 14.	Closed
HAI-111	Test Execution	Low	Sprint 4	Verify: Sensitivity 58% flagged amber on Results dashboard (Step 5)	Test execution item to confirm the amber sensitivity indicator. Logistic Regression (C=1.0) produces 58% sensitivity, which should be flagged amber	No Defect. Amber flag and safety banner functioning as designed. Banner text confirmed: "8 patients missed (False Negatives) — sent home	Closed

Issue ID	Type	Priority	Found	Summary	Description	Resolution	Status
					and accompanied by a clinical safety banner about missed cases.	without support but returned." Verified Image 12, Image 13.	
HAI-112	Test Execution	Low	Sprint 3	Verify: Privacy notice visible across all 7 steps	Test execution item to extend privacy notice coverage. Previously only verified on the Step 2 upload area (TR-034). Must be present across all steps per US-003.	No Defect. Privacy notice confirmed present across all steps. Session Storage architecture verified: no personal data persisted, cleared after session ends. Verified TR-034, Image 4.	Closed

Notes

Issues marked Test Execution were raised to verify that gate controls, safety banners, and modal behaviours operate correctly under specified conditions. No code change was required. Issues marked Bug represent defects found during testing that required a code fix before the sprint could close.

Evidence codes: TR_XXX refers to Sprint 3 manual test screenshots. Image xx refers to Sprint 4 full pipeline screenshots (April 14, 2026 report). All screenshots are documented in the SENG 384 Manual Test Reports.
